Executive Summary

What SANKHYA is. What ARTH.OS does. Why it matters.

SANKHYA is a financial cognition intelligence company. Its mission is to build the foundational infrastructure that helps human beings understand, improve, and act on their financial lives — not through more features or dashboards, but through a deeper, more honest understanding of the human mind behind money.

ARTH.OS is the world's first Financial Cognition System layered on a Financial Operating System. It does not track expenses. It tracks your **financial mind**. It does not measure wealth. It measures readiness, resilience, and decision quality.

*"Finance is not primarily a mathematics problem.
Finance is a cognition problem."*

MARKET POSITION

Day 1

Category being created

People do not fail financially because they cannot calculate. They fail because of behaviour, habits, biases, emotional reactions, and a fundamental lack of awareness. ARTH.OS is built to solve this.

Founding Thesis

The belief system that SANKHYA is built upon.

Every great company begins not with a product, but with a belief. A conviction about something that is fundamentally true about the world — and fundamentally broken about the current state of it.

"Human beings are the most important variable in their own financial equation — and no product today takes them seriously."

The Five Beliefs

1 · Cognition precedes action.

Every financial decision passes through the human mind first. Products that ignore this are incomplete by design.

2 · Awareness is the entry point.

Most people do not know where they truly stand financially. Creating honest awareness is the single most valuable thing a financial product can do.

3 · Behaviour determines outcomes more than income.

A person earning ₹30,000/month with excellent financial habits will outperform a person earning ₹3,00,000 with poor ones — over any 10-year horizon.

4 · The infrastructure layer is missing.

Banks, payments, lending, investment — all being solved. The intelligence layer that understands the human does not exist at scale.

5 · The platform that understands the human owns the relationship.

Whoever builds the deepest understanding of financial behaviour, cognition, and decision quality will own the most trusted position in a person's financial life.

Why SANKHYA Exists

The gap that was left open. The problem that was left unsolved.

SANKHYA exists because of a fundamental omission in the global financial services landscape. The most basic question a person has — "Am I going to be okay?" — remains unanswered by almost every product in existence.

What the Financial Ecosystem Solves

- Moving money (payments)
- Storing money (banking)
- Growing money (investments)
- Lending money (credit)
- Tracking transactions (expense tools)
- Measuring creditworthiness (credit bureaus)

What the Financial Ecosystem Does NOT Solve

- Why people make bad financial decisions
- How financial behaviour changes over time
- What the long-term consequences of current habits will be
- Whether a person is financially prepared for uncertainty
- How to improve financial decision quality — not just financial products

*"The financial system is built around products.
SANKHYA is built around people."*

The Name: SANKHYA

Sankhya is a Sanskrit word meaning numeral, calculation, and enumeration — one of the oldest schools of Indian philosophy, built on understanding reality through precise observation. SANKHYA counts what matters — not just money, but the mind behind it.

Why ARTH.OS Exists

The product that brings the vision to life.

"Artha" is Sanskrit for wealth, meaning, and livelihood — one of the four Purusharthas, the fundamental goals of human existence. ARTH.OS is the Operating System for your financial life.

What ARTH.OS Is NOT

- An expense tracker · A budgeting app · A banking product
- An investment platform · A credit score tool · A personal finance dashboard

These are implementation details. ARTH.OS transcends them.

The Distinction That Matters

Financial Operating System

Helps people **act** on money. Organises financial data. Describes the past. Tracks transactions. Measures wealth.

Financial Cognition System

Helps people **understand their mind** about money. Analyses financial behaviour. Predicts the future. Tracks decisions. Measures readiness.

*"Cognition comes before action. Understanding comes before guidance.
Awareness comes before transformation."*

The Financial Cognition Gap

The missing layer. Named clearly for the first time.

There is a gap in financial services that almost no one has named. We call it the **Financial Cognition Gap** — the space between what a person's financial data says about them, and what they actually understand about their own financial reality.

Three Layers of the Gap

THE AWARENESS GAP

Most people have no honest picture of their current financial position. They operate on feeling, not fact. They believe they are "doing okay" right until the moment they are not.

!

THE BEHAVIOUR GAP

Even when people have financial information, they cannot connect it to their own patterns. They do not see their own habits clearly enough to change them.

!

THE CONSEQUENCE GAP

People have almost no visibility into future consequences of present decisions. The compounding impact of small choices remains invisible until it is too late.

!

How People Actually Think About Money

"Am I doing okay financially?"

"Can I afford this right now?"

"What happens if something goes wrong?"

"Am I moving toward my goals?"

"Do I have enough to feel secure?"

"What does my future look like?"

"ARTH.OS is the first product designed to close all three layers of the Financial Cognition Gap simultaneously."

Why Existing Finance Products Fail

A structural critique of the current financial product landscape.

The industry assumes that access to financial products solves financial problems. It does not. Access to products without the cognition to use them well produces **worse outcomes**, not better ones.

Five Structural Failures

F1 · Products solve for transactions, not humans.

Every major financial product is built around a transaction type. The human making those transactions is an afterthought. No product has a model of the human at its core.

F2 · Information is mistaken for intelligence.

Dashboards produce enormous financial information. But information without interpretation is noise. People need clarity about what it means, not more data.

F3 · Behaviour is tracked but never improved.

Many apps track spending. Almost none actively work to improve it. Knowing you spent ■8,000 on dining is different from understanding why, and what to do instead.

F4 · Products are designed for the financially literate.

Most products assume a user who already understands finance. This excludes the vast majority of the population — and almost the entirety of emerging markets.

F5 · No product operates on future-state thinking.

Financial products are backward-looking. They tell you what happened. None tell you what is about to happen if nothing changes — the only information that truly motivates behavioural change.

Behaviour · Awareness · Stability

The three dimensions of true financial health.

SANKHYA identified three dimensions that together constitute genuine financial health. They are not about wealth. They are about readiness, resilience, and rationality.

BEHAVIOUR — 40% Weight

Financial behaviour is the aggregate of all financial decisions a person makes, habituated over time. It includes spending discipline, savings consistency, debt management, and the degree to which short-term impulses override long-term goals. Behaviour is not determined by income. It is determined by habit, identity, and awareness.

- Spending discipline · Savings consistency · Debt management patterns
- Impulse vs. planned purchases · Financial habit formation

AWARENESS — 30% Weight

Financial awareness is the accuracy of a person's mental model of their own financial reality. Most people operate with a significantly distorted picture — overestimating income, underestimating expenses, misunderstanding risk. Awareness is not intelligence. It is calibration.

- Accuracy of self-assessed financial position · Understanding of existing risks
- Knowledge of future consequences · Awareness of financial blind spots

STABILITY — 30% Weight

Financial stability is not about having money. It is about being resilient to disruption. Stability is the capacity to survive uncertainty — financially, emotionally, and practically.

- Emergency fund adequacy · Income source diversity · Fixed obligation ratio
- Recovery time from financial shock · Insurance adequacy

The BAS™ Framework

Behaviour + Awareness + Stability — The proprietary model at the heart of ARTH.OS

Three Operational Layers

Financial Health Score

"How financially healthy am I?" — The most honest answer.

Score Architecture

40%	BEHAVIOUR Spending discipline, savings habit, debt management
30%	AWARENESS Self-position accuracy, risk understanding
30%	STABILITY Emergency readiness, income resilience

Score Bands

800–1000	FINANCIALLY SOVEREIGN Exceptional readiness.
600–799	FINANCIALLY RESILIENT Strong. Weathers disruption.
400–599	FINANCIALLY DEVELOPING Moderate. Identifiable gaps.
200–399	FINANCIALLY FRAGILE Significant vulnerabilities.
0–199	FINANCIALLY CRITICAL Immediate action required.

The Survival Engine

Your first real financial reality check.

*"If my income stopped today —
how long could I continue living my current lifestyle?"*

Survival Window Calculation

MONTHLY ESSENTIAL EXPENSES

Fixed obligations + Minimum living costs

LIQUID AVAILABLE ASSETS

Savings + Accessible emergency funds

SURVIVAL WINDOW (DAYS)

$(\text{Liquid Assets} \div \text{Monthly Expenses}) \times 30$

Why the Survival Engine Works

Visceral awareness.

Telling someone their window is 18 days is more motivating than any graph of monthly spending.

Universal across incomes.

Whether earning ₹15,000 or ₹1,50,000/month — the Survival Window question hits equally hard.

Human-scale thinking.

People do not relate to "net worth". They relate to "how many days can I survive".

Urgency without alarm.

The Survival Engine does not manipulate. It shows the truth. The truth itself is motivating.

User Journey

From first touch to financial transformation.

01

ENTRY

Discovers ARTH.OS via Salary Roast, word of mouth, or organic reach. Hook: curiosity, not obligation.

02

BAS™ ASSESSMENT

5–7 minute assessment designed to feel like self-discovery. Target: 70%+ completion rate.

03

FINANCIAL HEALTH SCORE

Composite score with B/A/S breakdown. First moment of genuine, precise self-knowledge.

KEY MOMENT

04

SURVIVAL ENGINE

User sees their Survival Window. Emotional centrepiece — creates urgency, shareability, motivation.

KEY MOMENT

05

PERSONALISED INSIGHT

ARTH.OS surfaces the single most important insight. Not ten. One. The most impactful one.

06

RECOMMENDED ACTION

One specific, concrete action for this week. Not a plan. An action. Low friction. High impact.

KEY MOMENT

07

TRACKING & RETURN

Weekly check-ins. Score evolves. Insights deepen. The user builds a financial relationship.

MVP Blueprint

Built to prove the thesis — not everything.

The ARTH.OS MVP has a precise, non-negotiable scope. Its purpose is to validate the most fundamental hypothesis: that people engage with a product giving them honest visibility into their financial health — and that this translates into behavioural change.

Core Validation Objectives

- BAS™ Assessment completion rate → **target 70%+**
- Financial Health Score creates genuine emotional resonance and self-recognition
- Survival Engine creates urgency and willingness to act
- Single recommended action drives measurable behaviour change at Day 7 & Day 30
- Users return to check score → **target 40%+ Day 30 retention**

What Gets Built First — P0 Core

- **BAS™ Assessment** · 5–7 min survey. Adaptive. Progress indicators.
- **Financial Health Score** · Composite B/A/S. Visual. Shareable.
- **Survival Engine** · Survival Window. Honest, precise.
- **Personalised Insight** · AI-generated. Single most impactful.
- **Recommended Action** · One specific action. Low friction.

What Gets Built Next — P1 Phase 2

- **Score History** · Week-on-week tracking.
- **Salary Roast** · Shareable report. Viral growth mechanic.
- **SMS Integration** · Parse SMS to enrich BAS™ signals.

Explicitly Out of MVP Scope

Product Architecture

11 intelligence layers. Each builds on the last. Nothing is optional.

L01	Data Ingestion Layer	SMS parsing · Survey inputs · Behavioural signals · Transaction data	LIVE
L02	BAS™ Processing Engine	Converts raw signals into Behaviour, Awareness, Stability scores	LIVE
L03	Health Score Engine	Aggregates BAS™ into composite Financial Health Score	LIVE
L04	Survival Engine	Calculates Survival Window and financial runway metrics	LIVE
L05	Insight Generation Engine	AI-driven personalised insight synthesis — most impactful per user	LIVE
L06	Action Prescription Engine	Converts insights into specific, prioritised, actionable recommendations	LIVE
L07	Financial Cognition Layer	Models money beliefs, cognitive biases, behavioural patterns	PHASE 3
L08	Decision Intelligence Layer	Analyses decision quality and identifies decision risk factors	PHASE 4
L09	Prediction Engine	Forecasts future financial states and scenario simulations	PHASE 5
L10	Financial Memory	Longitudinal behaviour history and goal evolution tracking	PHASE 6
L11	Financial Digital Twin	Full simulation environment for financial futures	PHASE 7

▲ MVP (Phases 1–2) · ▲ Intelligence Layers (Phases 3–7)

Financial Cognition Layer

Where ARTH.OS moves from behaviour tracking to mind modelling.

The Financial Cognition Layer is what separates ARTH.OS from every other financial product in existence. The system stops describing what a person does with money, and starts understanding **why**.

What the Cognition Layer Models

Money Beliefs

Core beliefs about wealth — is money scarce or abundant? Is it a tool or an identity marker? These beliefs, often formed in childhood, determine financial behaviour more than any external factor.

Cognitive Bias Profile

ARTH.OS identifies which biases most affect financial decisions — present bias, loss aversion, optimism bias, sunk-cost fallacy, anchoring. Naming the bias is the first step to neutralising it.

Risk Perception Calibration

Most people's risk perception is systematically distorted. ARTH.OS calibrates a user's risk perception against objective probability, identifying where they over- or under-estimate.

Financial Emotional Triggers

What events or emotional states drive impulsive financial decisions? What creates financial anxiety? What creates false confidence? The Cognition Layer maps and tracks these triggers.

"Understanding why someone makes a financial decision is worth more than knowing what decision they made."

Decision Intelligence & Prediction Engine

From cognition to decision quality to forecasting the future.

Decision Intelligence Layer

If the Cognition Layer answers "how does this person think about money?", the Decision Intelligence Layer answers "which of their decisions are creating the most risk — and which would create the most value?"

- Every significant financial decision is captured and classified
- Decisions scored: goal alignment, value consistency, cognitive bias evidence, time orientation
- "You consistently make high-risk decisions when under time pressure"
- "If you had taken Option B in March, your Stability Score would be 40 points higher today"

Prediction Engine

Every other layer looks at what has happened. The Prediction Engine looks at what is about to happen — and what will happen if the user changes nothing.

Financial State Forecasting

Predicts the user's Health Score, Survival Window, and BAS™ dimensions 30, 90, and 180 days into the future based on current behaviour patterns.

Scenario Simulation

"If you increase monthly savings by ■3,000, your Survival Window extends by 47 days within 6 months." The user tests decisions before making them.

Risk & Opportunity Forecasting

"At your current spending rate, you will exhaust your emergency fund within 3 months." Specific, time-bound risk alerts and proactive opportunity guidance.

Financial Memory & Digital Twin

The layers that make ARTH.OS irreplaceable and impossible to replicate.

Financial Memory

Financial Memory converts ARTH.OS from a product into a relationship. Every financial product forgets you the moment you close it. ARTH.OS remembers everything.

- **Behaviour History** · Longitudinal record of decisions, goals, emotional responses, changes
- **Goal Evolution** · How goals change, what users stop caring about, what they start prioritising
- **Score Trajectory** · A narrative of financial growth, setbacks, recoveries, and breakthroughs
- **Contextual Memory** · "Last time you got a salary increment, you spent 80% within 30 days"

Financial Digital Twin

A complete, dynamic, real-time model of a user's financial life — past, present, and future — that can be simulated, stress-tested, and used to explore decisions before they are made.

*"Think of it as a flight simulator for your financial life.
You practice in the simulator before you fly the real thing."*

- Test major financial decisions before making them
- Simulate career change, home purchase, investment shifts — see probabilistic outcomes
- A Twin built on years of behavioural data is impossible to replicate. The longer a user stays,
- the richer their Twin becomes — creating compounding lock-in based on genuine value.

The Operating System Layer

When ARTH.OS becomes the platform through which all financial decisions are made.

The final architectural expression of ARTH.OS is the OS Layer — the point at which ARTH.OS is not just a product, but the infrastructure through which all financial interactions happen. The 10-year vision.

What an OS Means in Financial Services

An OS provides the foundational layer upon which all applications run. In finance, the OS is the intelligence infrastructure that sits between the user and all financial products — understanding the user, contextualising every decision, ensuring every interaction aligns with long-term financial health.

ARTH.OS as the Intelligence Layer

Banks, lenders, insurers, and investment platforms plug into ARTH.OS to deliver their services — contextualised by ARTH.OS's deep understanding of the user's financial health, behaviour, and cognition. ARTH.OS is the platform through which financial products are consumed, not the product itself.

The Network Effect

As more financial products integrate with ARTH.OS, the user's financial intelligence improves. As intelligence improves, more products want to integrate. A network effect impossible to replicate without the user base and the data.

*"SANKHYA does not aim to beat any existing financial player.
It aims to sit above all of them — as the intelligence layer they did not build."*

Strategic Moats

Five compounding defensibilities. Each strengthens the others.

01	Proprietary Behavioural Dataset The largest, most richly structured dataset of Indian financial behaviour. Cannot be purchased, replicated, or approximated by any new entrant.	STRENGTH
02	BAS™ as Intellectual Infrastructure A proprietary framework for understanding financial health. Refined through millions of interactions, it becomes a model competitors cannot build without the data that created it.	STRENGTH
03	Longitudinal User Relationships ARTH.OS improves the longer a user stays. A 3-year user has a Digital Twin of extraordinary precision. Switching costs based on genuine value — the most durable kind.	STRENGTH
04	Trust as the Primary Asset ARTH.OS operates in the most sensitive domain — financial reality. Trust, once earned here, is extremely difficult to displace. SANKHYA is the trusted advisor, not the product vendor.	STRENGTH
05	Cognition Layer Network Effects As Cognition Layer models improve through data, they improve for all users. Competitors cannot replicate these effects without the user base and behavioural history.	STRENGTH

*"The platform that understands the human owns the relationship.
SANKHYA is building that platform."*

Competitive Positioning

SANKHYA is creating a category, not entering one.

SANKHYA does not have direct competitors — because the category it is creating does not yet exist. Adjacent players define the white space SANKHYA occupies.

The Competitive Landscape

CATEGORY	EXAMPLES	WHAT THEY DO	WHAT THEY MISS
Credit Bureaus	CIBIL, Experian	Measure creditworthiness	Behaviour, cognition, health, future
Expense Trackers	Walnut, Money View	Track spending	Intelligence, cognition, prescriptions
Neobanks	Jupiter, Fi	Better banking UX	Financial health layer entirely
Investment Platforms	Zerodha, Groww	Enable investing	Behavioural suitability, readiness
Insurance Platforms	PolicyBazaar	Distribute insurance	Financial health context
Financial Advisors	Human advisors	Personalised advice	Scale, accessibility, affordability

"SANKHYA sits above all of these — as the intelligence layer that connects data to behaviour to outcomes."

The Real Competition

The real competition for SANKHYA is not any existing company. It is inertia — the assumption that financial services have been built correctly, and that the human mind is someone else's problem.

Risk Assessment

Honest assessment of what could go wrong — and how we think about it.

SANKHYA is built on the belief that honest risk assessment is a prerequisite for building durable companies. These risks are real, material, and require active mitigation.

HIGH

Assessment Completion Drop-off

Risk: Users abandon the BAS™ Assessment before completion, preventing score generation.

Mitigation: UX optimisation. Progressive disclosure. Emotional hooks. Salary Roast as completion incentive.

HIGH

Data Quality in SMS Parsing

Risk: SMS transaction data is inconsistently formatted across banks, leading to poor signal quality.

Mitigation: Conservative parsing with human-verified training data. Graceful degradation to survey signals.

MEDIUM

Low Day-30 Retention

Risk: Users engage once and do not return, limiting behavioural data accumulation.

Mitigation: Weekly score updates. Personalised check-ins. Score improvement notifications. Progress milestones.

MEDIUM

Regulatory Changes

Risk: RBI regulation changes affecting data access or financial advice boundaries.

Mitigation: Conservative positioning of ARTH.OS as financial awareness, not advice. Legal counsel.

MEDIUM

Category Awareness Gap

Risk: Users do not understand what a Financial Cognition System is, making acquisition difficult.

Mitigation: Lead with emotional outcomes ("Know your Survival Window"), not category labels.

LOW

Large Platform Entry

Risk: Google, Paytm, or HDFC builds a similar product.

Mitigation: Proprietary dataset moat. BAS™ depth. Longitudinal relationships. Speed of category leadership.

LOW

Monetisation Delay

Risk: Product proves conceptual value but struggles to convert engagement into revenue.

Mitigation: B2B2C model — selling BAS™ intelligence to lenders and insurers as revenue bridge.

Assumptions & Open Questions

What must be true. What we have not yet answered.

Strategic Assumptions

A1 · People will engage with honest financial self-assessment.

The value proposition assumes users engage with difficult truths about their financial health — if delivered with clarity, empathy, and utility.

A2 · Behavioural signals are richer predictors than transactional data alone.

How people decide is more predictive of financial outcomes than what they spend.

A3 · The B2B market for behavioural financial intelligence materialises within 18 months.

Lenders, insurers, and wealth managers paying for BAS™-powered risk signals is a core monetisation assumption.

A4 · Technical co-founder can be recruited within 3–6 months.

This is an honest operational assumption. The entire product roadmap depends on it.

Open Questions

Q1 · What is the right monetisation sequencing?

Freemium consumer model vs B2B2C? The answer depends on data only early cohorts can provide.

Q2 · Can the BAS™ framework be validated academically?

Academic validation as a legitimate psychometric instrument would strengthen credibility with institutional partners.

Q3 · What does category-creation marketing look like at this budget?

Creating a new category requires significant narrative investment at scale. How SANKHYA builds awareness efficiently is an open strategic question.

Strategic Roadmap

8-phase evolution from MVP to Financial Operating System.

Long-Term Vision

What SANKHYA is building toward over the next 20 years.

The 20-year vision is an ambition about what becomes possible when a critical mass of human financial intelligence is understood, modelled, and improved at scale.

05

YEARS

HORIZON

Cognition at Scale

ARTH.OS is the most trusted financial intelligence product in India, with tens of millions of active users. BAS™ is validated and institutionalised. The Financial Health Score is a recognised standard for financial wellness.

10

YEARS

HORIZON

The Operating System

ARTH.OS functions as the intelligence infrastructure layer for Indian financial services, expanding across Southeast Asia. Banks and lenders integrate ARTH.OS as the trust layer through which they serve customers.

20

YEARS

HORIZON

Cognition Infrastructure for Humanity

Financial Cognition Infrastructure exists globally — the intelligence layer between every human being and every financial decision. The global financial system becomes more humane, equitable, and aligned with the actual humans it serves.

"The measure of SANKHYA's success is not users or revenue.

It is the aggregate improvement in financial outcomes for every person who interacts with ARTH.OS."

I started SANKHYA because I was tired of watching people around me make the same financial mistakes, over and over, not because they were unintelligent or irresponsible — but because no product in existence gave them honest, precise, compassionate visibility into what was actually happening in their financial lives.

I watched friends with good incomes live paycheck to paycheck. I watched families with modest means build genuine financial resilience through discipline and awareness alone. I saw that income was a weak predictor of financial outcomes. Behaviour and awareness were the real variables. And no one was measuring them.

ARTH.OS is my attempt to fix that. Not just for a niche. For everyone. For the person earning ₹12,000 a month in a tier-3 city who deserves the same quality of financial intelligence as a high-net-worth individual with a private banker.

SANKHYA is pre-MVP. We have a vision, a framework, a product architecture, and the conviction that this is one of the most important things that can be built in Indian fintech in the next decade.

If you are reading this document, you may be one of those people.

The question is: do you see what I see?
